

Lecture 9: Building a Geodatabase

Sergiy Kostrikov

Geographic Information Systems / Geodatabases for
Human Geographers – PhD Courses

Spring 2018

Reminders

- You should look through the Basic Geodatabase textbook

Objectives

- Become proficient in the use of GIS tools to conduct spatial analyses.
- Locate and obtain geospatial data resources from federal, state, and local data providers.
- Correctly convert data into a common coordinate system appropriate for a study site and objectives.
- Work with data in formats common to GIS, including shapefiles, rasters, and geodatabases.

Why are we covering geodatabases?

- It is the native data structure for ArcGIS
- Primary data format used for editing and data management
- Much of the powerful functionality of ArcGIS depends on geodatabase models

First, Some Design Considerations

- What kind of geodatabase do you need?

- Single User
 - File geodatabase
 - A folder of files that is cross platform
 - Datasets can be up to 1 TB in size (with configuration larger)
 - Best default choice ←
 - Personal geodatabase
 - Stores data in Microsoft Access
 - Limited to ~250 – 500 MB for the entire geodatabase
 - Only supported on Windows
- Multi User
 - Enterprise geodatabase
 - Required for multiple simultaneous users
 - Implemented within Relational Database Management System (RDBMS) software
 - Required for archive, replication, SQL querying, multi-user editing

What are the thematic layers I need to include?

- Roads, streams, soils, terrain?
- Develop specification for representing the contents of each thematic layer in the database

A map showing a river and surrounding land parcels. A red arrow points from the 'Parcels' layer in the diagram to this map.

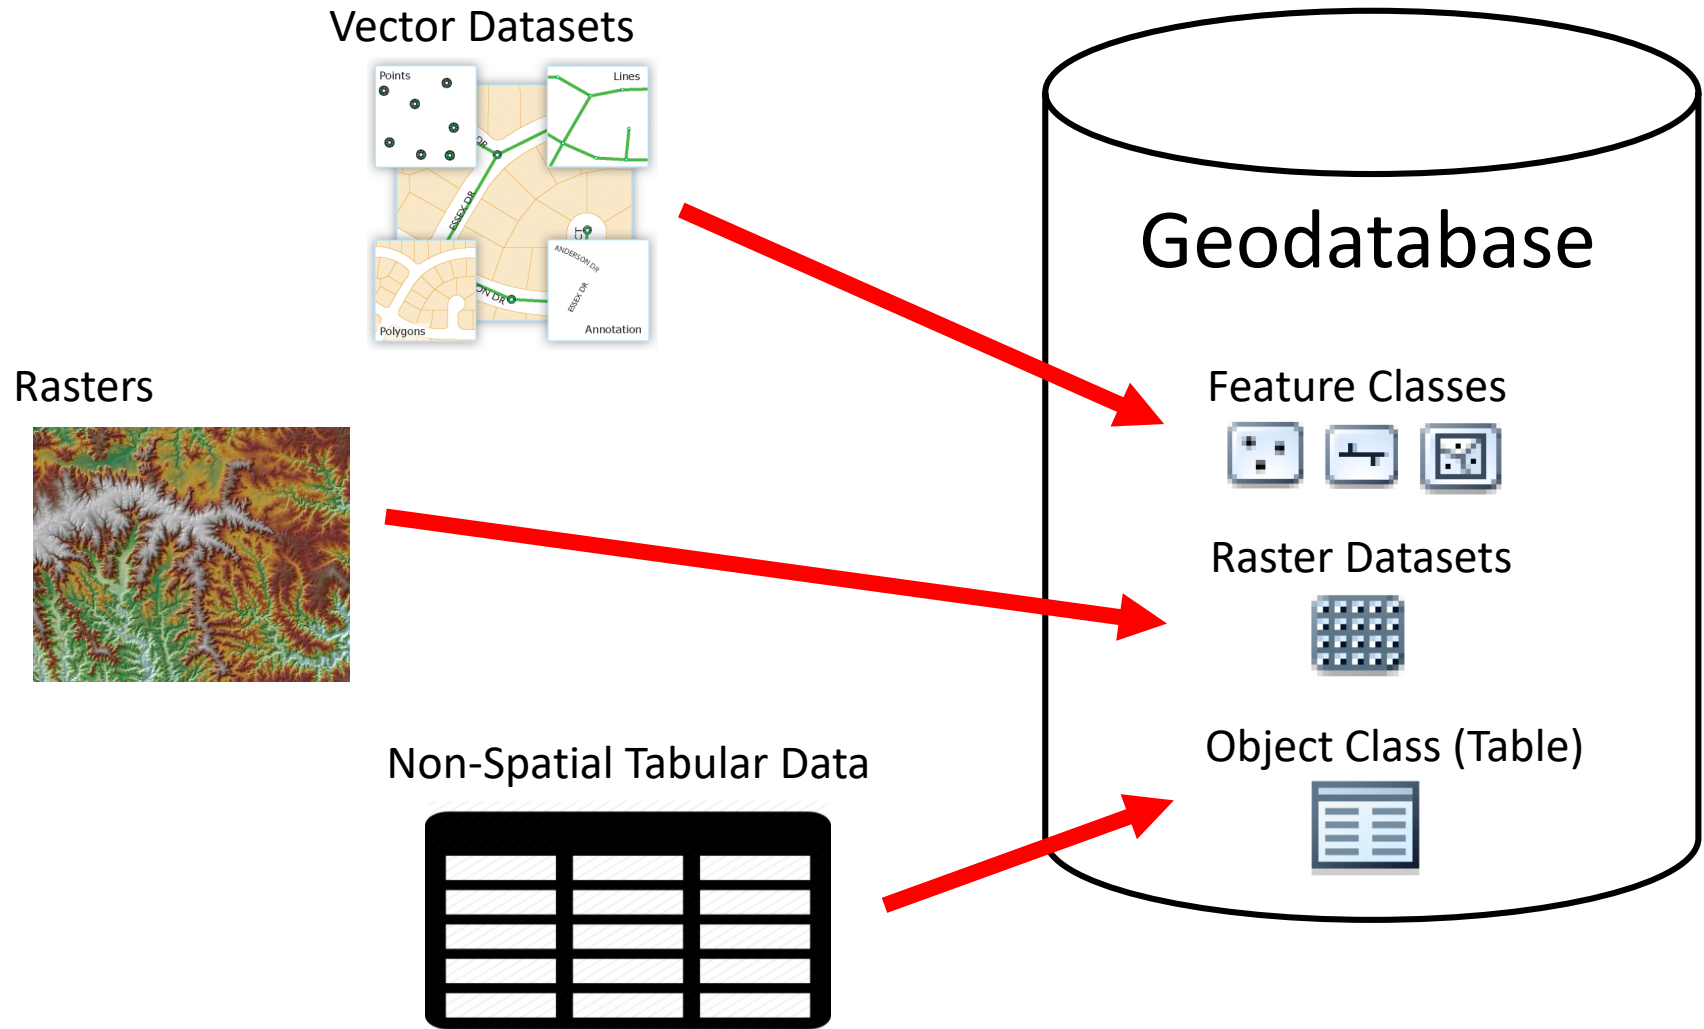

Layer	Ownership parcels
Map use	Parcels define land ownership and are used for taxation
Data source	Compiled from land ownership transactions at local government
Representation	Polygons in survey-aware feature classes and related annotation
Spatial relationships	Parcel Polygons cannot overlap and are covered by boundary lines
Map scale and accuracy	Typical map scales are 1:1200 and 1:2400
Symbology and annotation	Parcels often drawn using boundary features and related annotation

What is the correct geographic representation for each thematic layer?

- Elevation as a raster of elevations or as a vector dataset of elevation contours? Both?
- Can be determined by how you intend to use the data

What object types do I need in my database?

What are the attribute fields and their data types for each dataset?

- What columns do I need in the table for each dataset?
- What data type should each column in a table have?
 - Numbers (multiple)
 - Text
 - Dates
 - BLOBs
 - Object IDs (automatic)
 - Global IDs
 - Raster
 - Geometry

Table

Parcels

OBJECTID *	Property ID *	Landuse Code	Parcel ID	Residential	Zoning Simple
1542	2542	1	3899	Non-Residential	Commercial
1543	2543	1	3900	Residential	Residential
1545	2545	1	3902	Non-Residential	Commercial
1546	2546	1	3903	Residential	Residential
1547	2547	1	3904	Non-Residential	Commercial
1548	2548	1	3905	Non-Residential	Commercial
1549	2549	1	3906	Non-Residential	Commercial
1550	2550	1	3907	Residential	Residential
1551	2551	1	3908	Non-Residential	Commercial
1552	2552	1	3909	Residential	Residential
1553	6553	0	7910	Non-Residential	<Null>
1555	2555	1	3912	Non-Residential	Institutional
1556	2556	1	3913	Residential	Residential
1557	2557	1	3914	Non-Residential	Commercial

1487 (2012 out of 3523 Selected)

Parcels

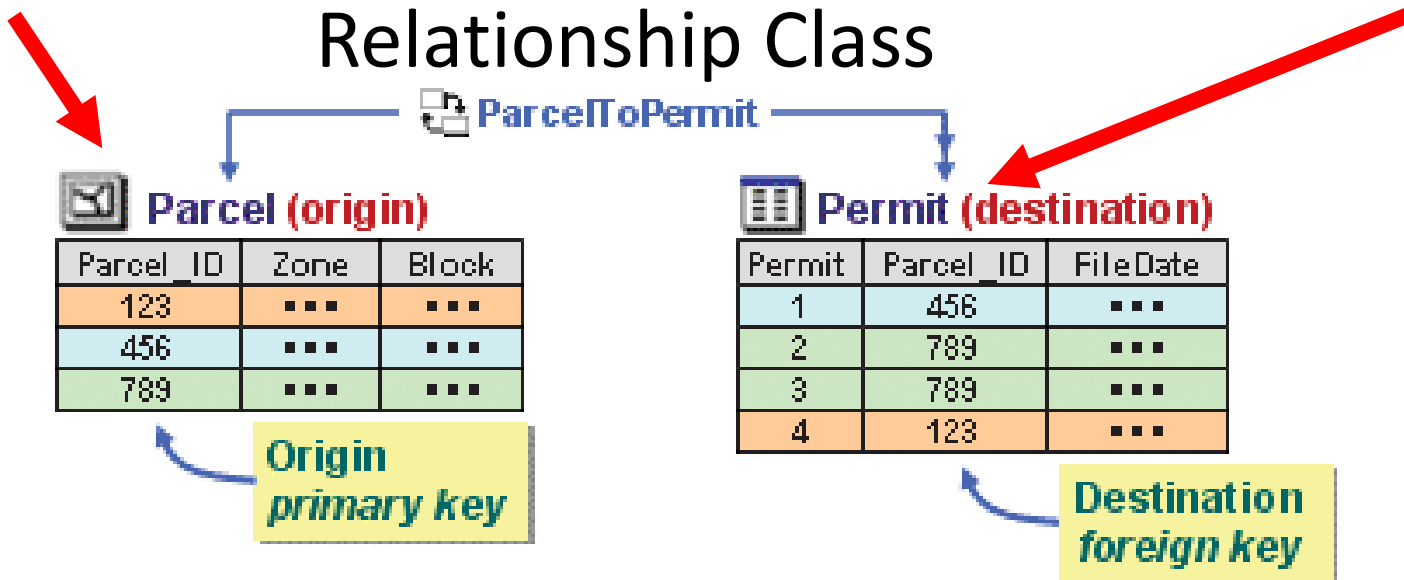

Are there important relationships I need to capture?

- Are there tables containing additional data related to the geospatial location data?

Parent Feature
Class

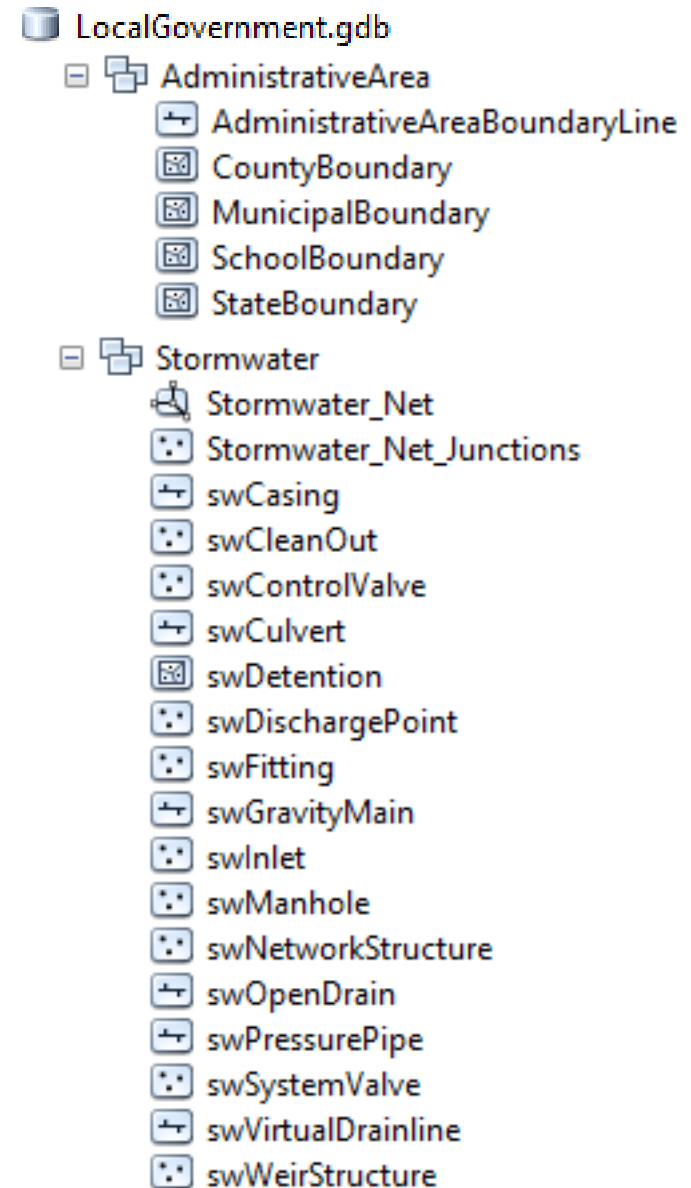

Table with related
information

Relationship Class

How should my datasets be organized?

- Are there spatially related feature classes that should be grouped into a feature dataset?
- Advanced topics: are you using one of the following?
 - Topology
 - Network dataset
 - Terrain dataset (TIN)

Do you need geodatabase elements to facilitate data editing and manage data integrity?

- Coded value domains – require attribute values to be selected from a list
- Subtypes – require features to be one of a set of available subtypes
- Relationships – allow records in one table only when related records exist in another

Coded value domain	
TSDDataType	
Description	
Field type	Long integer
Split policy	Default value
Merge policy	Default value
Code	Description
1	Instantaneous
2	Cumulative
3	Incremental
4	Average
5	Maximum
6	Minimum

Line feature class
Boundary

Subtypes are Water, Right of Way, Subdivision Boundary, Parcel Split, Lot Line, Parcel, Private Road

Create a New Geodatabase

- Three methods:
 1. Design and create a new empty geodatabase
 2. Copy and modify an existing geodatabase schema (empty database)
 3. Create a copy of the schema and contents from an existing geodatabase

ArcGIS Data Models

- ESRI has developed a series of geodatabase model templates
- These can be used as-is or as the basis for a more advanced implementation
- To use an existing ESRI data model:
 1. Download the appropriate data model
<http://support.esri.com/datamodels>
 2. Create an empty file geodatabase
 3. Import the schema and set up the appropriate spatial reference for its contents. See
<http://desktop.arcgis.com/en/desktop/latest/manage-data/geodatabases/copying-the-schema-of-a-geodatabase-about-copying-.htm>
 4. Load some data
 5. Test and refine

Existing ESRI Data Models

- Address
- Agriculture
- Atmospheric
- Basemap
- Biodiversity
- BroadbandStat
- Building Interior Space
- Carbon Footprint
- Census – Admin Boundaries
- Defense – Intel
- Energy Utilities
- Environmental Regulated Facilities
- Fire Service
- Forest Service
- Forestry
- Geology
- Groundwater
- Health
- . . .

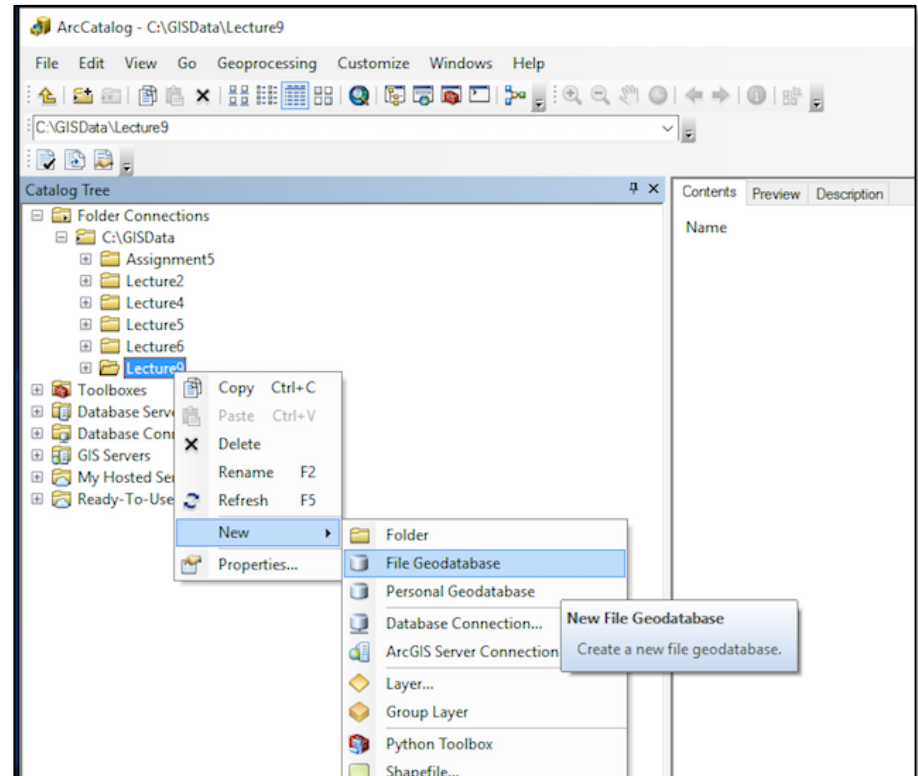

Learn More: <http://support.esri.com/en/knowledgebase/techarticles/detail/40585>

Creating a Geodatabase

- A useful and more in depth tutorial:
<http://desktop.arcgis.com/en/desktop/latest/manage-data/geodatabases/a-quick-tour-of-the-building-geodatabases-tutorial.htm>

Create a New File Geodatabase

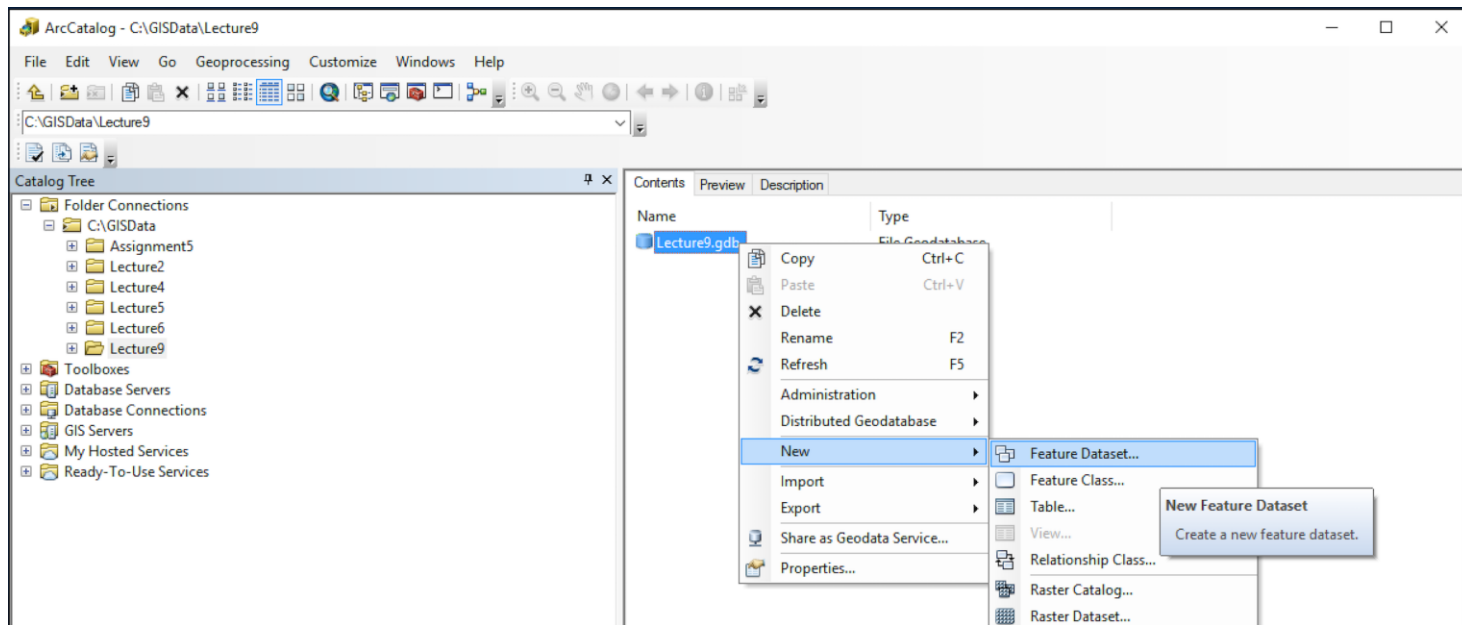

1. Open ArcCatalog (or the Catalog Window in ArcMap)
2. Navigate to folder where you want to create the geodatabase in the Catalog tree
3. Right click on the folder where you want to create the geodatabase, point to “New”, and click “File Geodatabase”

NOTE: You can rename a geodatabase by right clicking on the geodatabase and selecting “Rename” from the context menu

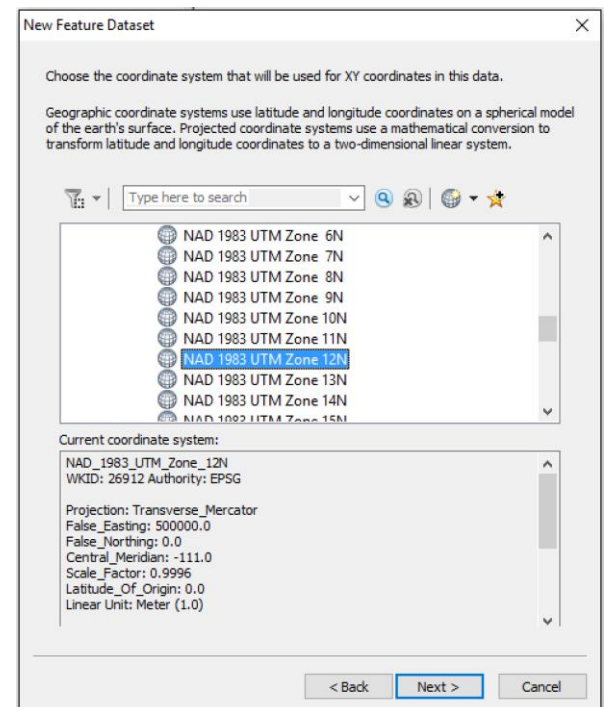

Create a Feature Dataset

1. Right click on the geodatabase
2. Click New --> Feature Dataset
3. Give your Feature Dataset a name
4. Choose a coordinate system (all of the feature classes in your feature dataset must use the same coordinate system)

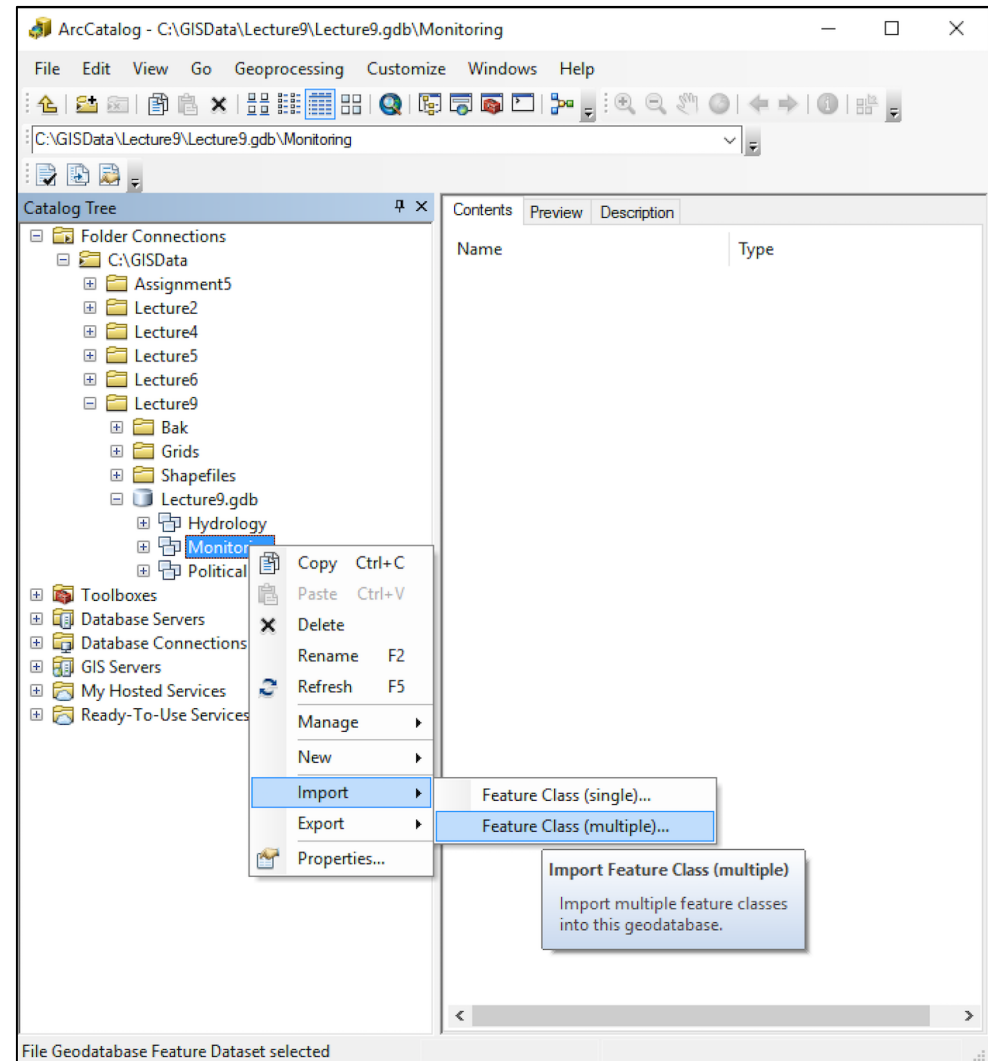

Choose Coordinate Systems

- XY Coordinate System: NAD 1983 UTM Zone 12N
- Z Coordinate System: NAVD 1988

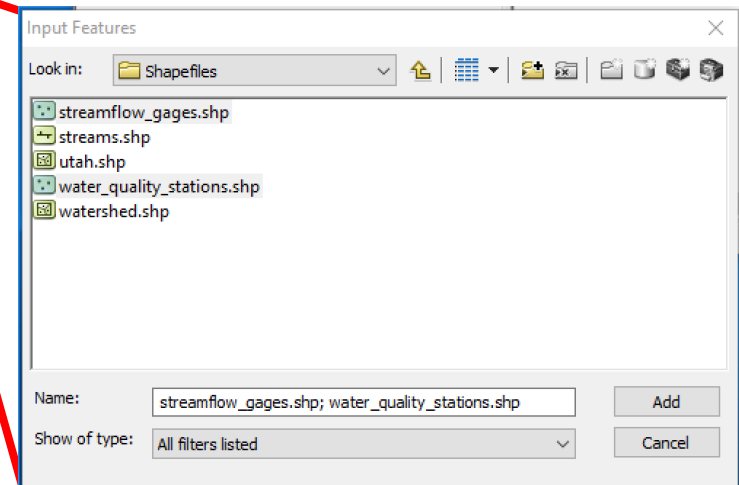

Create Feature Classes

- Two methods
 - Create new, empty feature class
 - Import feature class from shapefiles or layer files
- Right click on Feature Dataset
 - New
 - Import

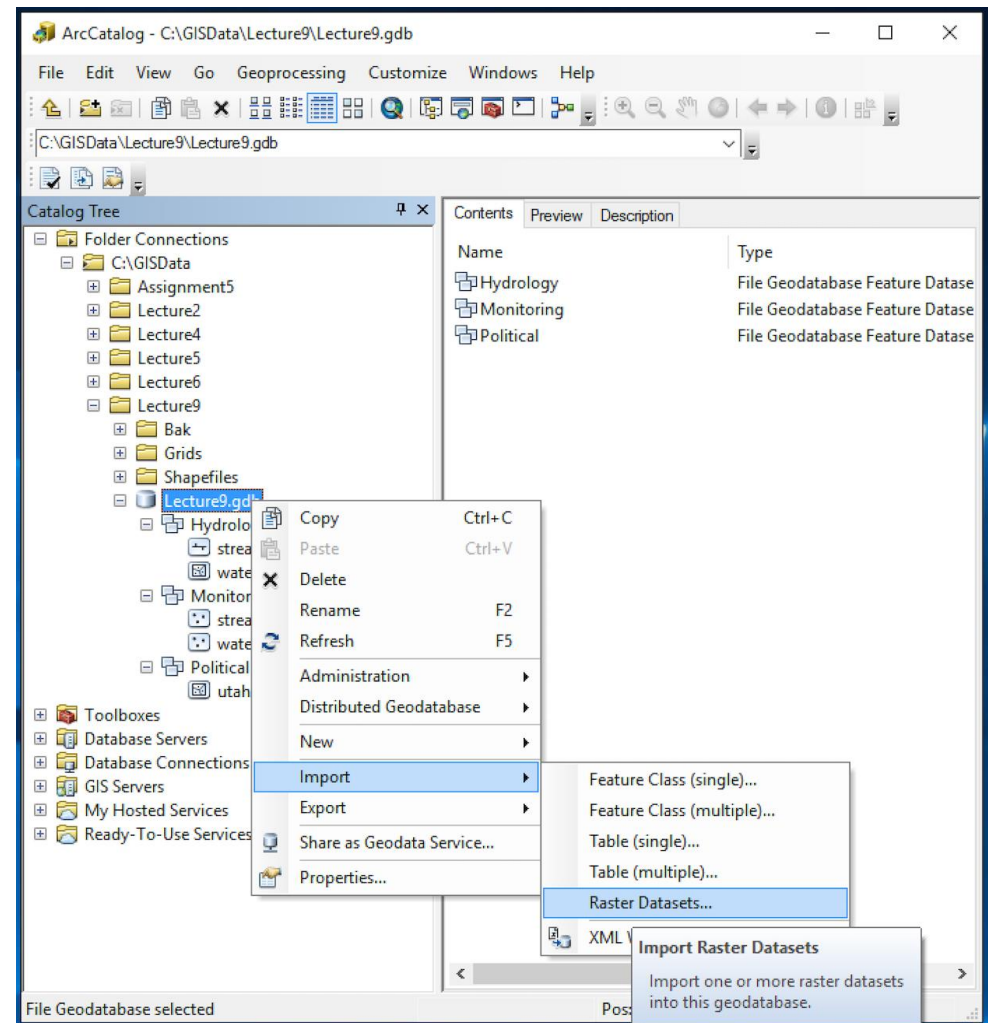

Import Feature Classes

- Import Feature Class (multiple)
- Choose feature classes to import

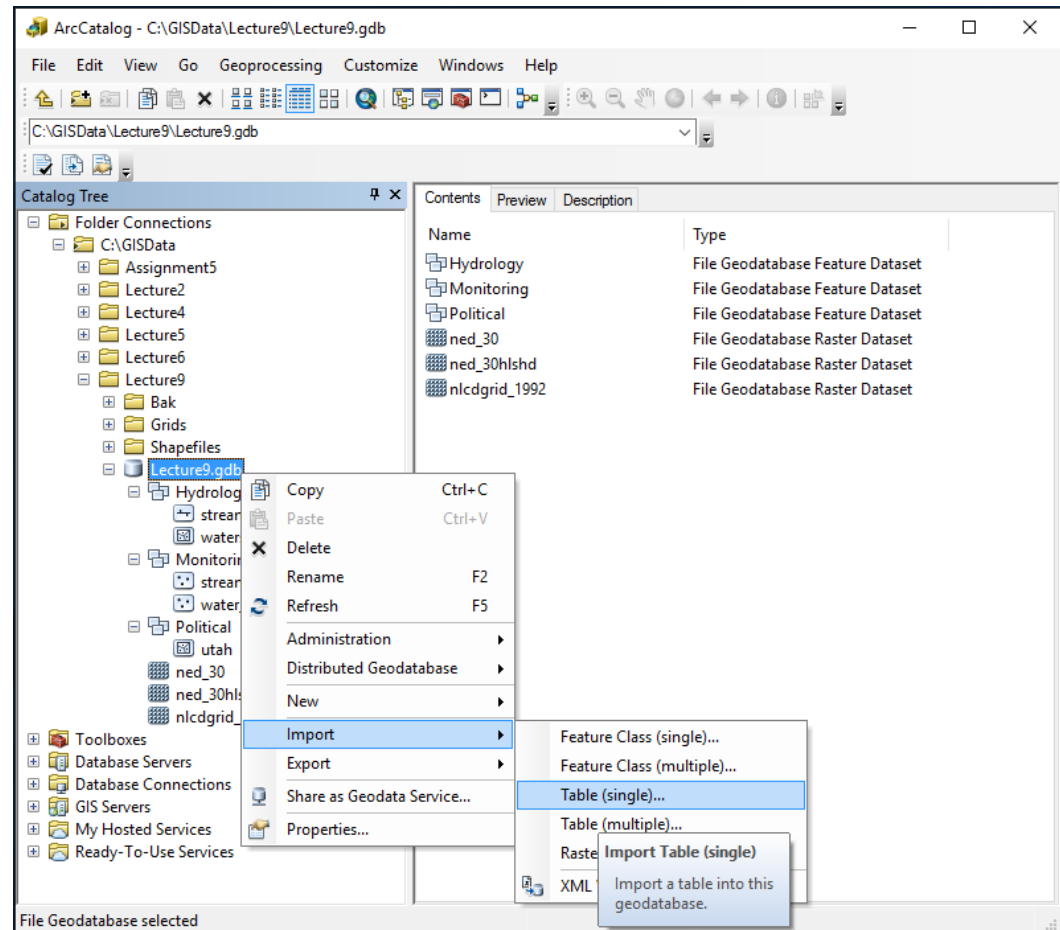

Create a Raster Dataset

- Right click on geodatabase
- Import --> Raster Datasets...

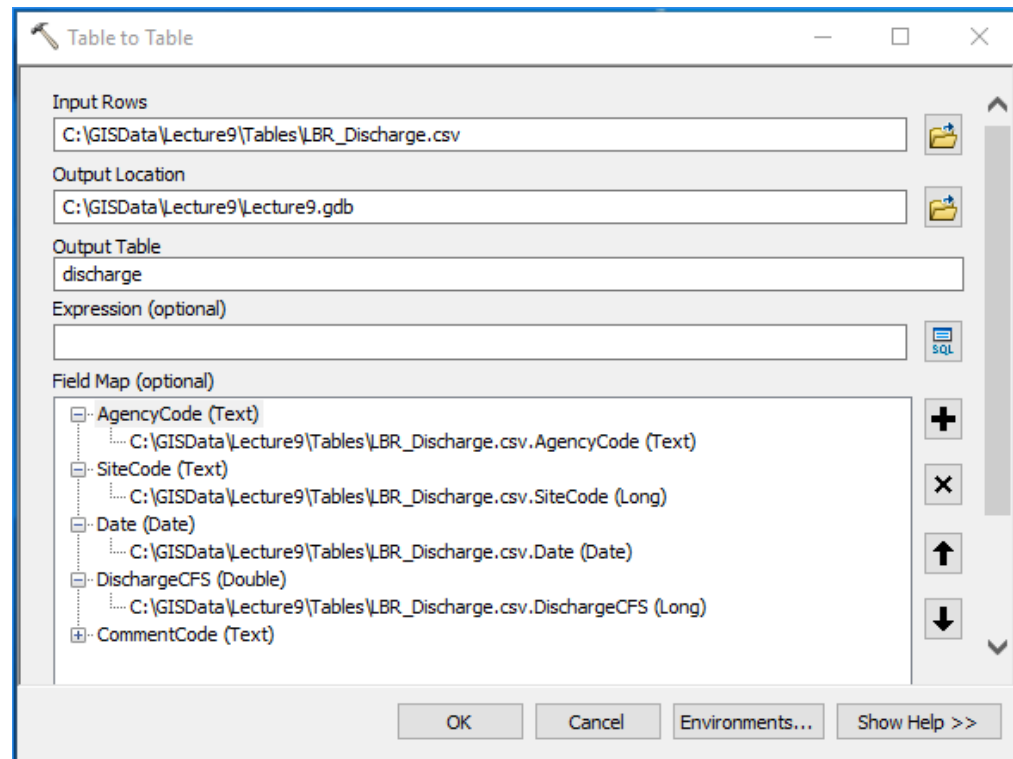

Create a Table

- Right click on geodatabase
 - New --> Table: create a new empty table
 - Import --> Table: import a table from an existing file

Import Table from File

- Supported formats:
 - Excel (if you have it installed) (.xlsx)
 - Comma separated values (.csv)
 - dBASE (.dbf)
 - A couple of other less common formats
- Must specify:
 - Input rows (the input file)
 - Output location (the geodatabase)
 - Output table (name)
 - An expression (optional)
 - Field data type mapping (optional)

Some Notes about Data Type Mapping

- AgencyCode = Text
- SiteCode = Text (Length =10)
- Date = Date
- DischargeCFS = Double (Precision = 8, Scale = 2)
- CommentCode = Text

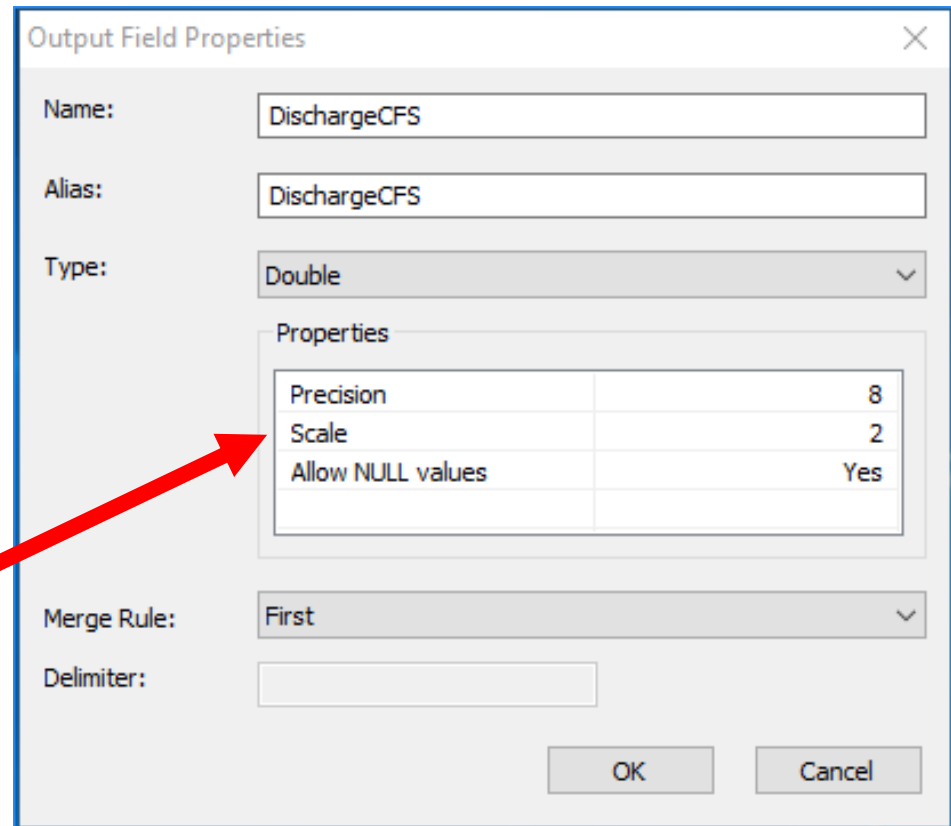

Length: Total number of characters

Precision: The total number of digits stored (total field length)

Scale: The total number of decimal places

Allow Nulls: Can the field be empty?

Right click on the Field name and select “Properties” to modify the data type mapping

Output Field Properties

Name: DischargeCFS

Alias: DischargeCFS

Type: Double

Properties	
Precision	8
Scale	2
Allow NULL values	Yes

Merge Rule: First

Delimiter:

OK Cancel

Create a Relationship Class

- Right click on geodatabase
- New --> Relationship Class

Connect streamflow gage locations to discharge values measured at those sites

SitesToDischarge

streamflow_gages			
OBJECTID *	Shape *	STATION *	STATION_NA
1	Point	10104600	SOUTH FORK LITTLE BEAR RIVER NEAR AVON, UT
2	Point	10104700	LITTLE BEAR RIVER BELOW DAVENPORT CREEK NEAR AVON, UT
3	Point	10104900	EAST FORK LITTLE BEAR RIVER ABOVE RESERVOIR NEAR AVON, UT
4	Point	10105000	EAST FORK LITTLE BEAR RIVER NEAR AVON, UT
5	Point	10105900	LITTLE BEAR RIVER AT PARADISE, UT
6	Point	10106000	LITTLE BEAR RIVER NEAR PARADISE, UT
7	Point	10107500	LITTLE BEAR RIVER NEAR HYRUM, UT

streamflow_gages (origin)

discharge

1	USGS	10104600	7/1/1966	13	A
2	USGS	10104600	7/2/1966	13	A
3	USGS	10104600	7/3/1966	13	A
4	USGS	10104600	7/4/1966	13	A
5	USGS	10104600	7/5/1966	13	A
6	USGS	10104600	7/6/1966	13	A
7	USGS	10104600	7/7/1966	12	A
8	USGS	10104600	7/8/1966	12	A

discharge (destination)

Origin and Destination

- Origin table/Feature class:
“streamflow_gages”
- Destination table/Feature class:
“discharge”

New Relationship Class

Name of the relationship class:
SitesToDischarge

Select the table/feature classes that will be associated by this relationship class.

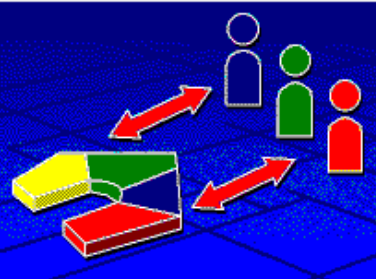

Origin table/feature class:

- Hydrology
 - Monitoring
 - streamflow_gages
 - water_quality_stations
 - Political
 - discharge

Destination table/feature class:

- Hydrology
 - Monitoring
 - Political
 - discharge

A relationship class is a collection of relationships between objects in two tables/feature classes.

Parcels are owned by owners.
Owners own parcels.

< Back Next > Cancel

Relationship Types

- Simple
 - No referential integrity
 - Both tables can exist independent of the other
- Composite
 - Existence of records in the destination table depend on a related record in the source table

Example: Can discharge values exist in the database if there is no related gage site where they were measured?

New Relationship Class

Select the type of relationship that this relationship class will store.

☐ Simple (peer to peer) relationship

Simple or peer-to-peer relationships are relationships that exist between two or more objects in the database that can exist independent of each other. In this kind of relationship, when the object(s) in the origin table/feature class are deleted, the related object(s) in the destination table/feature class are not deleted by default.

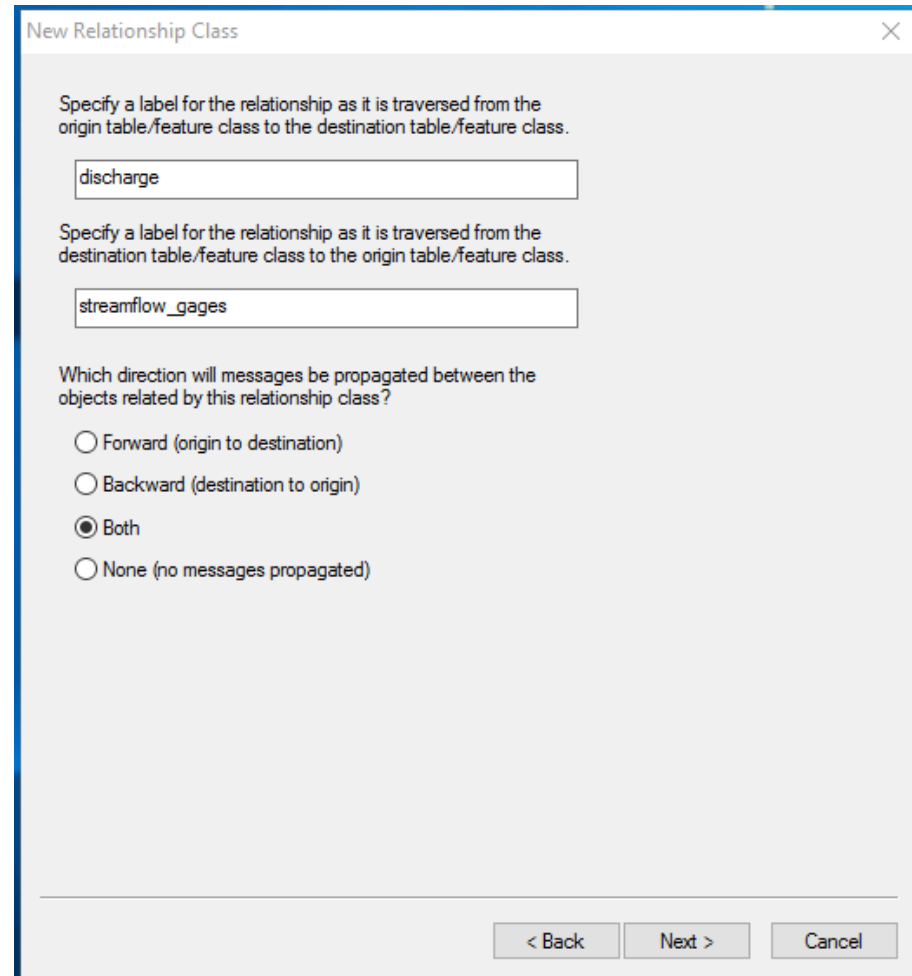

☒ Composite relationship

Composite relationships are relationships where the lifetime of the object(s) in the destination table/feature class are controlled by the lifetime of their related object in the origin table/feature class. When the object in the origin table/feature class is deleted, the related object(s) in the destination table/feature class are also deleted.

< Back Next > Cancel

Labels and Message Propagation

- When you select a gage site, do you want related discharge values to be automatically selected?
- When you select discharge values, do you want the related site(s) to be automatically selected?

The screenshot shows a dialog box titled "New Relationship Class" with a close button (X) in the top right corner. The dialog contains two text input fields and a radio button group. The first text field is labeled "Specify a label for the relationship as it is traversed from the origin table/feature class to the destination table/feature class." and contains the text "discharge". The second text field is labeled "Specify a label for the relationship as it is traversed from the destination table/feature class to the origin table/feature class." and contains the text "streamflow_gages". Below these fields is a section titled "Which direction will messages be propagated between the objects related by this relationship class?" with four radio button options: "Forward (origin to destination)", "Backward (destination to origin)", "Both" (which is selected), and "None (no messages propagated)". At the bottom of the dialog are three buttons: "< Back", "Next >", and "Cancel".

New Relationship Class

Specify a label for the relationship as it is traversed from the origin table/feature class to the destination table/feature class.

discharge

Specify a label for the relationship as it is traversed from the destination table/feature class to the origin table/feature class.

streamflow_gages

Which direction will messages be propagated between the objects related by this relationship class?

☐ Forward (origin to destination)

☐ Backward (destination to origin)

☒ Both

☐ None (no messages propagated)

< Back Next > Cancel

Cardinality

- **1 – 1 (one to one)**: There is one related record in each table on both sides of the relationship
- **1 – M (one to many)**: One record in the table on one side of the relationship is related to many records in the table on the other side
- **M – N (many to many)**: A complex relationship that requires a bridge table

New Relationship Class

Select the cardinality for this relationship class (origin - destination).

☐ 1 - 1 (one to one)

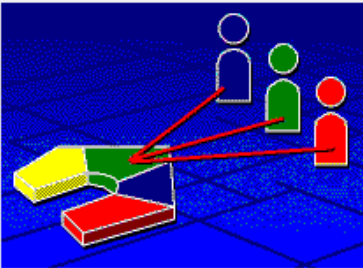

☒ 1 - M (one to many)

☐ M - N (many to many)

Note: If this is a composite relationship class, then the cardinality must be 1-1 (one-to-one) or 1-M (one-to-many)

In a 1-M (one to many) relationship, each object in the origin table/feature class can be related to multiple objects in the destination table/feature class.

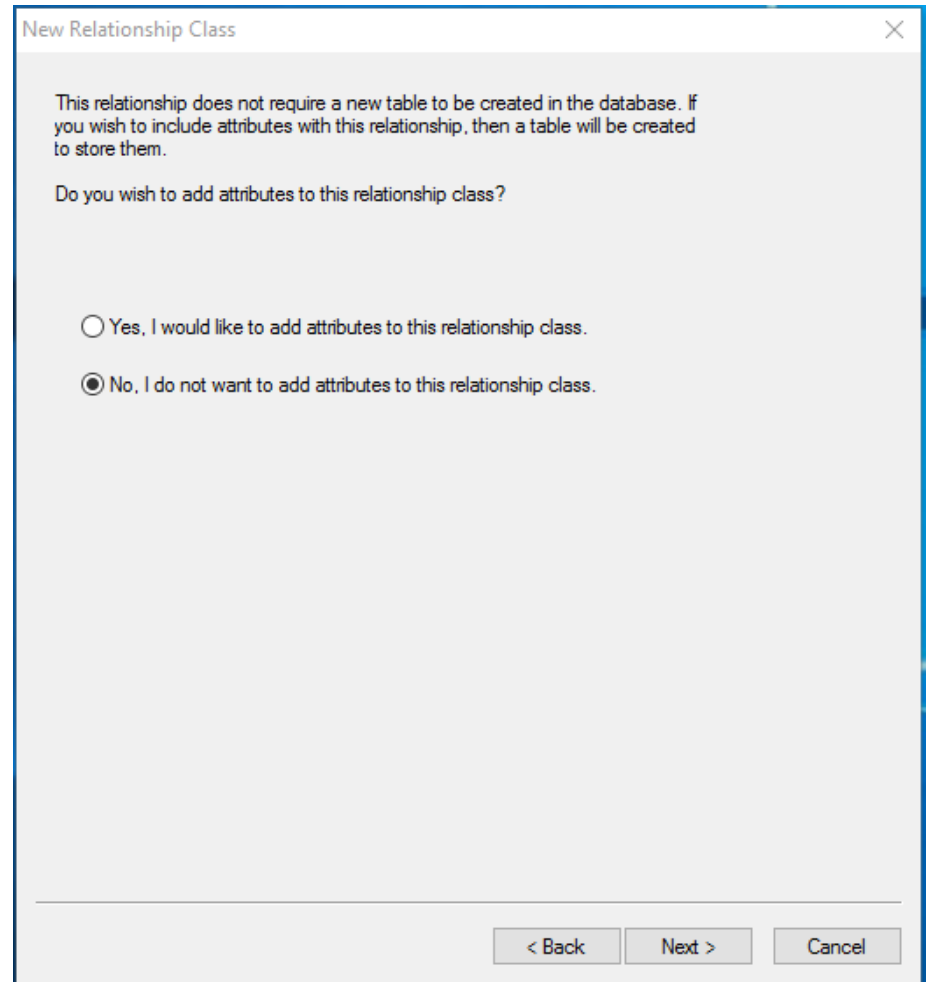

Parcels Table/Feature Class Owners Table/Feature Class

< Back Next > Cancel

Attributes for the Relationship

- Can be stored in an additional table
- Not required for most relationships
- A new “bridge” table is required for “many-to-many” relationships

The screenshot shows a dialog box titled "New Relationship Class" with a close button (X) in the top right corner. The main text inside the dialog reads: "This relationship does not require a new table to be created in the database. If you wish to include attributes with this relationship, then a table will be created to store them." Below this text is a question: "Do you wish to add attributes to this relationship class?". There are two radio button options: "Yes, I would like to add attributes to this relationship class." and "No, I do not want to add attributes to this relationship class." The "No" option is selected. At the bottom of the dialog, there are three buttons: "< Back", "Next >", and "Cancel".

Primary and Foreign Keys

- The attribute columns on which the tables are linked
- Do not have to have the same name
- **Must** have the same data type

New Relationship Class

Select the primary key in the origin table/feature class (generally, this will be the object identifier field). Select the foreign key in the destination table/feature class.

Select the primary key field in the origin table/feature class:

STATION

Select the foreign key field in the destination table/feature class that refers to the primary key field in the origin table/feature class:

SiteCode

< Back Next > Cancel

discharge (destination)

Result

- Three Feature Datasets
- Five Feature Classes
- Three Raster Datasets
- One Table
- One Relationship Class

Advantages of File Geodatabases vs. Personal Geodatabase and Shapefiles

- Compatible with Windows and Linux platforms
- Optimized performance (outperform in both size limitations and speed)
- Storing both vector and raster datasets together
- Less restrictive editing locks (per table rather than entire database)
- Can use data compression to reduce storage requirements
- Data integrity tools (e.g., coded domains, relationships)
- Simpler to create relationships

Summary

- Design considerations for geodatabases include
 - Geodatabase type
 - Thematic layers to include
 - Geographic representation of thematic layers
 - Selection of object types, attributes and relationships
- Geodatabases enable organization of thematic layers (e.g., Feature Datasets)
- ArcGIS provides tools for creating geodatabases and importing data
- A number of geodatabase data models are already available for use
- Geodatabase design and implementation is an iterative process that may need to be refined over time

Additional Resources

- Geodatabase design steps:
<http://desktop.arcgis.com/en/desktop/latest/manage-data/geodatabases/geodatabase-design-steps.htm>

Assignment 3 – Building a Geodatabase

- Finish building the geodatabase we began today in class
 - Feature datasets and feature classes
 - Raster datasets
 - Object class (table) and relationship
- Choose a study area of some sort
- Create a new file geodatabase for your study area
- Create 1 or more Feature Datasets
- Create or load at least 2 feature classes
- Download the NED DEM for your study area and load it into your geodatabase
